                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence encodes the 110 kD catalytic subunit of the phosphatidyl inositol (PtdIns) 3-kinase. This sequence was transformed into schizosaccharomyces pombe cells under the regulatory control of the nmt promoter in an embodiment of the invention. In the presence of thiamine the promoter is inactive and the cells carrying the PtdIns catalytic subunit plasmid grow as the parental strain. In the absence of thiamine the nmt promoter functions and the PtdIns 3-kinase catalytic subunit in induced. PtdIns activity is substantially

----GlnAsnGluArgAspPheValLeuArgValCys 275
polymer is located at a predetermined position on the solid support, are the array comprises nucleic acid polymers which are specific for less than 100 genes other than the selected genes. The method is useful for determining tumour characteristics in a tissue sample taken from a patient. The present sequence represents a human lipid-associated gene related cDNA sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ValValGlnThrLeuAspCysLeuArgTyrTrpLysValLeuHisArgSerProGlyGln

The present invention relates to identifying a modulator of the phosphatidylinositol 3-kinase (P13K; pilodelta) enzyme that binds to the catalytic subunit via a SH3 domain-containing polypeptide such as inASP-1. Also described are methods of assaying the specific binding affinity of the P13-kinase binding partner. Such modulators are useful for the treatment of diseases characterised by the undesirable or excessive activity of P13Kdelta. For example the modulators are useful for inhibiting the growth or proliferation of cancer cells (e.g. malignant neoplasms of lymphoid and reticuloendothelial tissues, Hodgkin's lymphoma, leukaemias), inflammatory diseases (e.g. rheumatoid arthitis), ophthalmic disorders (e.g. allorgic conjunctivitis), obtained in contact demarking explammatory bowel diseases (e.g. chronic inflammatory bowel disease), inflammatory deramatorse (e.g. chronic inflammatory bowel disease), inflammatory deramaticis, central or peripheral nervous system inflammatory disorders (e.g. seningitis), bacterial pneumonia, and Type I diabetes mellitus. The present sequence encodes for human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          264

Ы,

```
Southern blot analysis was performed using a bovine cDNA probe contg.

a fragment of a PI3-kinase-encoding sequence and human CDNA isolated
from a CDNA library constructed from MRNA isolated from the human
cell line KGla. Positive clones were sequenced to give the human
cell line KGla. Positive clones were sequence has 95 percent
homology with the bovine sequence. The domain encoding residues 19-
100 of human pilo is sufficient to encode the kinase which will
associate with the p85 kinase subunit. The gene may be used to
provide a protein with PI3 kinase activity, and is useful for
screening for (ant)agoniers of PI3 kinase activity which could be
useful for stimulation or inhibition of cell proliferation and hence
prophylaxis or therapy. Platelet or neutrophil activity or blood
glucose levels can be controlled using the kinase.
Clucose levels can be controlled using the kinase.
Clucose levels can be correct passing of Field.)
Cludated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |||| |||||| ::::: | |||||| ATGCCTCCAAGACTGAACTGTGGGGGCATCCACTTGATGCCCCCAAGAATC

a fragment of a P13-kinase-encoding sequence and human cDNA isolated

cf from a cDNA ilbrary constructed from mRNA isolated from the human

cell line KGla. Positive clones were sequence to give the human

cell line KGla. Positive clones were sequence to give the human

DISTAL STATES PILLS SEQUENCE. The domain encoding residues 19-

100 of human pl10 is sufficient to encode the kinase which will

associate with the p85 kinase subunit. The gene may be used to

provide a protein with P13 kinase activity, and is useful for

screaning for (ant) agonists of P13 kinase activity which could be

useful for stimulation or inhibition of cell proliferation and hence

prophylaxis or therapy. Platelet or neutrophil activity or blood

glucose levels can be controlled using the kinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel antisense compound (1) 8-30 nucleobases in length targeted to a start codon or nucleobases 4-3174 of the coding region of human p13 kinase pil0beta (II), in which (I) specifically hybridizes with and inhibits the expression of (II). The products of the invention have cytostatic, antiinflammatory and antiinfective activity. (I) is useful for inhibiting the expression of (II) in human cells or tissues. The antisense compound can be utilized for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The antisense compounds may also be useful prophylactically, e.g. to prevent or delay infection, inflammation or tumor formation. The antisense compounds are useful for research and diagnostics, because these compounds hybridize to nucleic acids encoding (II).
                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense compound 8-30 nucleobases in length targeted to a start codon of the coding region of human P13 kinase p110beta, useful for inhibiting the expression of the human polynucleotide -
